

Effortlessly migrate user profile data and settings

Simple. Scalable. Low cost

User Profile Wizard is a powerful workstation migration tool that will join your machine to a domain, and share your original user profile with your new domain logon so that you can carry on using all your existing data, and keep the same settings that you've always had.

Large-scale migration made easy

User Profile Wizard has been used to automatically migrate hundreds of thousands of workstations to the current Microsoft platform. It can be used to migrate to a new domain from an existing Windows network, from a Novell NDS network or join standalone computers to a domain for the first time.

No need to lose personal data and settings

As the Windows operating system has developed, User Profiles have become ever more important and are now an integral part of the way that Windows organizes data. In some circumstances however, this tying of data to a single user account can be a problem. User Profile Wizard allows you to share your original profile with your domain logon, and with the User Profile Wizard command line interface and the User Profile Wizard Deployment Kit you can build a scalable, enterprise solution to automatically migrate tens of thousands of workstations.

Scalable - up or down

Unlike some alternatives, User Profile Wizard does not assume that there is an enterprise directory in place. It supports environments from Small Business Server through to Global Domain Consolidation.
